

The background of the slide features a dark, moody photograph. On the left, the silhouette of a person's head and shoulders is visible, looking out towards the right. On the right side, a window looks out onto a city at night, with blurred lights from buildings and streets creating a bokeh effect. The overall color palette is dark, with shades of blue, grey, and black, punctuated by the warm, out-of-focus lights of the city.

SAFERISE PROTOCOL

Regulation as infrastructure.

A curated protocol system for emotional regulation — helping people recover enough internal resource and command of attention to perceive more clearly, judge more soundly, and respond more deliberately.

Business development assessment · Andre Robley · Kenor International B.V.

THE MARKET

Large, compounding, and unusually unconsolidated.

\$9.45B

mental health apps, 2026

14.8%

CAGR to 2031

15%

held by the top five

31%

growth in US corporate wellness app programmes

The mental health apps market was valued at \$8.40B in 2025 and is estimated to reach \$18.81B by 2031. The wider wellness apps market runs \$14.81B in 2026 toward \$51.12B by 2035.

The top five — Calm, Headspace, Talkspace, Teladoc, Woebot — held roughly 15% between them in 2025, the leader under 6%. This is not a market with an incumbent to displace. It is a market with room underneath.

Two failures, both structural.

52%

of users report data-security concerns limit their engagement. Every major platform stores emotional data on its own servers.

Records are device-only. Never synced, never opened to leadership.

47%

cite lack of personalisation as the limit. Generic calm content cannot meet a specific state at the moment it arrives.

30 protocols, each routed to a named state — not a content library.

Neither is a feature gap. Both follow from business models built on data capture and undifferentiated content — which is why an incumbent cannot copy the answer without giving up the model underneath.

WHAT IT COSTS

It does not stay in one place.

Sleep lost to a mind that will not close.

Patience spent before evening begins.

Decisions delayed because clarity is out of reach.

The state passes. Its effects do not — they land in the ordinary hours, and on the people nearby.

THE POSITION

Most systems teach calm. This one teaches understanding.

Regulation is not the destination. It is the condition that makes clear perception possible.

The purpose of regulation is not relief. It is the recovered capacity to choose what happens next — which is why the product is defined by what it refuses as much as by what it offers.

Not generic wellness

Not a course

Not gamified self-improvement

Not a therapy replacement

Not luxury wellness

Not an outcome promise

One sequence. Every protocol.

Attention → Awareness → Authorship

01

Recognise

Bring the experience into view without diagnosis or fixed identity

02

Regulate

Create enough steadiness to regain command of attention

03

Release

Loosen struggle, self-blame and the demand to resolve everything now

04

Rise

Return to deliberate participation, and a caring action

The same four steps run in every protocol, on every track, and in every language it is translated into. That consistency is the product.

Three layers. Most programmes work one.

01 • WHAT WE TRAIN

Capacity

Noticing the state, regulating it, recovering choice.

Sits below every skill you have trained and above every decision made

02 • WHAT IT DEPENDS ON

Substrate

Sleep, nutrition, training load, chronic stress.

Whether that capacity is physically available at all

03 • WHERE IT LANDS

Application

Conversations, decisions, performance, the shift.

The only layer most wellbeing and L&D spend touches

The arrow runs both ways. Degraded capacity produces the decisions that wreck sleep; poor sleep degrades capacity further. SafeRise is where a person can interrupt that loop rather than be carried by it.

This is why Sleep, Nutrition and Strength are not adjacent markets. Without substrate there is no capacity, and the platform would be teaching people to regulate on an empty tank.

WHY IT SURVIVES CLINICAL SCRUTINY

Six frameworks, tiered by evidence.

PEER-REVIEWED — LEADS EVERY CLINICAL AND INVESTOR CONVERSATION

Porges	Polyvagal Theory — autonomic state and safety
HeartMath	Cardiac coherence — heart-rhythm and regulation
Kross	Distanced self-talk — perspective and rumination

CLINICAL PRACTICE AND INTERPRETIVE — LABELLED AS SUCH, NEVER PRESENTED AS MECHANISM

Maté	Compassionate Inquiry — clinical practice
Jung	Shadow and individuation — interpretive
Watts	Non-resistance — interpretive

The tiering is the defence. A reviewer who challenges Jung finds it already labelled interpretive — with the peer-reviewed layer standing independently underneath.

Eleven things this product will never say.

No diagnosis

No guaranteed outcomes

No claim personal experience is universal

No promise of curing anxiety or trauma

No dependency mechanics

No gamification

No pressure to complete a transformation

No unsupported physiological claims

No forced trauma narratives

No requirement to find a root cause first

No framing that outside support is unnecessary

Lived experience, metaphor, plausible mechanism and established evidence are held apart at every layer — and the separation is audited, not assumed.

Recognition before persuasion.

The homepage has one job: build recognition. Not explain the method, not present the science, not sell a plan.

Documentary hero	A real sentence from a real experience, not a value proposition
Recognition bridge	Names the pattern before it names the product
Three contextual doors	On my own · With someone · At work
Roadmap only	Future tracks appear as direction, never as product cards

A person arriving in distress reaches the protocol they came for without passing through a sales moment.

No onboarding cliff. Twelve resources behind every protocol.

The member layer

- ◇ Three ways in on the first screen — settle, continue, or answer two questions and be routed
- ◇ No intake form, no labels, no assessment to finish before anything is useful
- ◇ Access management sits with account settings, away from protocol navigation
- ◇ The record they build stays on their own device

The depth

- ◇ Guided session · somatic release · explanation · perspectives
- ◇ Cue card · disclosure language · private journal
- ◇ A member who finishes one protocol finds eleven more things behind it
- ◇ Depth is the retention mechanism, not streaks

30

protocols

308

resources

151,773

words

14

framework assets

One visual language across every protocol.

Transformation word, title, promise. A fixed four-level card hierarchy, a controlled palette per track, and image rules covering encoding, crop, representation and emotional accuracy — nothing enters the repository unchecked.

Six hundred images, one rulebook. A member recognises a protocol before they read its name, and a buyer sees a system rather than a collection.

Purchase events, not personas.

People do not buy regulation because they find nervous systems interesting. They buy at a moment — and the moment selects the track.

Rupture	A relationship breaks, or nearly does	Relationship Healing
Escalation	Anxiety, anger or shutdown becomes unmanageable	Personal Transformation
Exposure	Promotion, visibility, a room that judges	Professional Performance
Depletion	Burnout, decision fatigue, arrival that feels like nothing	Professional · Elevation
Transition	New parent, separation, relocation, career change	Multiple tracks
Identity	Intimacy, discipline, the body, money	Six roadmap tracks

Each event recurs across a life. Someone who arrives at rupture returns at exposure — which is what makes cumulative access the correct commercial architecture.

Four streams. Four buyers. One asset.

Subscription <i>B2C individual</i>	Track 01 free · €19 Tracks 02–04 · €29 all eight Annual at ten months — €190 and €290. Adding a track inside a tier never costs more	Compounds
Premium 1:1 <i>B2C high-intent</i>	€129 · €349 for three Launch rate €79 · €199 while the market is tested	Calendar-capped
Workshops <i>B2C community</i>	€29 single · €39 per couple Remote. Global reach, no venue cost	Calendar-capped
Organisations <i>B2B</i>	Workshop · retreat · annual access By size of organisation, waterfall tiered. Never by usage	Lumpy, high value

One content asset serves all four. A protocol written once is sold to an individual, delivered in a session, taught in a workshop and licensed to an employer — with no additional production cost.
The €29 tier opens as the library doubles in month four, at €290 a year.

The whole library. Plus what is yours.

CORE LIBRARY · EVERY MEMBER, EVERY ORGANISATIONAL SEAT

in development

+ Curated by sector

Healthcare and emergency · Finance, legal and professional services · Technology and engineering · Manufacturing and logistics · Sales and client-facing · Leadership and people managers

Each sector gets a different route through the same library, and the facilitated sessions follow that route. Nobody has to predict who needs what — a person whose strain changes does not need a different licence.

The seller already knows this buyer.

SafeRise's corporate offer is an employee-experience product — the exact category sold for a decade. Jamf: employee technology enablement. HashiCorp: IT operations. Both into HR, IT and Operations committees, through procurement and legal, at five and six figures.

Not a new market. A different product into a buyer and a buying process already understood.

We are forbidden from promising results.

Productivity, optimise, efficiency, output, performance target — the words an HR buyer uses to justify a budget line — are prohibited. We do not break the rule. We sell four things that are true instead: a defined facilitated day · privacy by architecture · verifiable qualification · and the refusal itself.

The warm network already exists. Reactivating it is the highest-yield channel available, and it costs nothing.

470+

new logos acquired

360+

customer territory built

€5M+

ARR delivered

Three buyers. Three budgets. One account.

The corporate offer is not one product sold to one department. It is three, on three separate budget lines — and the second and third do not depend on the first being bought.

Preventative Baseline provision for the whole population	HR · Chief People Officer Buyer	Wellbeing budget Budget
Professional performance Capability under pressure, department-specific	VP Sales · VP Engineering · Head of Trading Buyer	Enablement or departmental Budget
Acute recovery Support after an incident	C-suite · Chief Legal · Chief Risk Buyer	Operational or risk Budget

The middle tier bypasses HR entirely. A VP of Engineering with an on-call problem has their own budget and does not need a wellbeing mandate to spend it.

Where the state is the job hazard.

TIER A	Financial services · Technology	Hyper-arousal, chronic vigilance	Decision Fatigue · High-Stakes Presence · Burnout
TIER B	Healthcare · Legal · Mental health · Social care	Shutdown, compassion fatigue, exposure	Shutdown Recovery · Grief Integration · Perfectionism
TIER C	Aviation · Manufacturing · Logistics	Cognitive overload, sustained arousal	Decision Fatigue · Overwhelm Threshold · Conflict
TIER D	Education	Budget-constrained, district licence reaches hundreds	Conflict Navigation · Burnout · Overwhelm
HELD	Law enforcement · Fire · Military	Highest resonance, highest trauma exposure — and an empty clinical layer. Not sold until a licensed clinician is contracted.	

One base. A thin layer on top.

A sector track is not a new product. It is ten protocols of sector-specific language and scenario on top of a base that is already written — roughly 30 to 55 per cent new writing.

SECTOR LAYER	Ten protocols · sector language and scenarios · 30–55% new writing
SHARED BASE	Thirty protocols · 308 resources · Recognise, Regulate, Release, Rise

Worked example — healthcare and emergency: four of the six needs are already written. Shutdown Recovery, Shame Dissolution, Grief Integration and Burnout & Overload all exist. Only shift-disrupted sleep and exposure aftermath are new.

That is why a sector track costs €6,400–8,500 rather than a full build — and why each one improves the margin on every one after it.

Paid from the first room.

1	Organisation workshop	€1,800	The entry, and the first paid engagement
2	Half-day retreat	€2,400 • €3,500 • scoped	To 50 • 51–120 • above 120 scoped
3	Annual access, all staff	By size of organisation	Waterfall tiered. The recurring line — never priced per seat
4	Conference, festival, event	Custom	Highest visibility, best lead source

Annual access is priced on total headcount and tiered as a waterfall, never by usage — so the privacy promise survives the pricing model completely. Per-seat pricing would require counting individual usage, which is the one thing the product refuses to do.

Give away the best work. Sell the depth.

Track 01 becomes free — ten complete protocols, the broadest-appeal work on the platform, given away in full. Every operator in this segment leads with free and monetises depth; SafeRise had no entry point at all. And it needs no payment rail, so the free tier launches while merchant approval is still in process.

Warm network reactivation	470+ named contacts, many now senior. Exists today. Costs nothing	Corporate
Outbound to European tech HR	Core competence. Sequenced, MEDDICC-qualified, run as a real pipeline	Corporate
Free remote workshop	Monthly. Feeds the free tier and fills 1:1 slots	Consumer
Free track as the SEO asset	Ten protocols of genuine content, once the site is indexed	Consumer
Speaking — HR and People events	20 minutes in front of 40 decision-makers beats 100 emails	Corporate
Collaborator audiences	Dwight's audience and Aleksandra's market	Both

What happens, and when.

To 30 September

Beta opens. Indexing switched on. All 31 meditations mastered and live. Payment rail live, or the free tier opens without it.

Days 1–18

First cohort runs the protocols. Completion and return measured. First workshop filled.

Days 19–32

Workshop delivered. Testimonials captured. Payment tested end to end. First conversion number in hand.

Days 33–45

Gate A reviewed against the conversion and churn floors. First 1:1 sessions delivered.

Days 46–60

Corporate outreach opens with retention data in hand. Warm list worked. First organisation workshop scoped.

The free tier needs no external approval — the only part of this that nothing outside the business can hold up.

Two axes, both already specified.

Vertical — six roadmap tracks

Elevation Series · Sex & Intimacy · Fitness Mindset · Addiction Recovery
· Nutrition & Body · Money Mindset

Each track is a new market, not a new feature. The architecture is fixed; a new track is content into a system that already works.

Horizontal — language

French and Spanish first. The Caribbean is natively multilingual and the founder is based in it. The method translates without re-derivation: four steps, six frameworks, one architecture.

Localisation is a translation cost against an asset already written — not a second product. That is materially different economics from building a new track, and it doubles addressable reach per unit of spend.

Remote delivery removes the geographic ceiling entirely — the addressable market is wherever the free tier reaches, not wherever the founder is.

Four things a competitor cannot simply copy.

The refusal

No streaks, scores or dependency mechanics. Adopting this means surrendering the retention model a competitor's forecast depends on

The corpus

151,773 words across 30 protocols, written to one method. Reproducing it is 2,300 hours, not a sprint

Device-only records

Structural, not a policy. Unavailable to anyone whose revenue includes employer analytics

Founder-market fit

A decade of enterprise employee-experience selling plus three practitioner certifications. Rare in either direction, rarer together

Note: an adjacent iOS product markets itself as “Regulate. Rewire. Rise.” Name proximity is a live trademark question and is carried on the risk register.

Built for the scrutiny, not retrofitted to it.

Data residency

Supabase, Frankfurt (eu-central-1). Controller is Kenor International B.V.

Chapter V transfer

Remote access from a third country can itself constitute a transfer. Transfer Impact Assessment scoped; SCC mechanism under formal review

Article 9

Journal entries may reveal health data. Basis identified as Art. 6(1)(a) with Art. 9(2)(a) explicit consent

Device boundary

No diagnosis, no treatment claim, no outcome promise — which is what keeps the product outside the regulated device perimeter

IP position

Corpus, method, taxonomy and brand system owned outright. No licensed content, no third-party curriculum

Not legal sign-off. The analysis is complete; formal review is scoped and budgeted. That distinction is stated deliberately.

Enterprise seller. Certified practitioner.

Andre Robley

8+ years enterprise SaaS — Jamf, HashiCorp, FeedbackFruits. €5M+ ARR delivered, 470+ new logos, a territory built to 360+ customers, Eagle Award for highest regional attainment. MEDDICC, multi-stakeholder, procurement and legal.

Certified Jungian Practitioner · Certified Somatic Coach · Meditation Coach

Kirsten Morris

Clinical lead — owns clinical requirements, escalation criteria and protocol review, and sources third-party licensed practitioners when a track requires one

Aleksandra Macura

Nutrition, the body, behaviour change — track partner and corporate component

Dwight Williams

Discipline and men's audience — co-branded track and podcast, revenue-shared

Key-person risk is real and named: the corpus, method and commercial relationships sit with one person today. Documented handover architecture exists; a second contracted operator is a stated post-raise priority.

WHAT IS ALREADY IN

\$232,005 of work, already delivered.

2,644

hours of measured work — 66.1 full-time weeks

Replacement cost at contractor rates. Not a valuation. Founder time carries no invoice; this is the number that would have appeared on one. \$15,000 of cash has gone in alongside it.

Product & content	\$87,065	977 hrs
Web & engineering	\$86,200	1,134 hrs
Business & commercial	\$58,740	533 hrs

The corpus, method, design system, member architecture and framework layer are built. What remains is consolidation, QA, legal completion and distribution — not conceptual invention. The bridge ahead asks for \$15,000, which doubles the cash in and buys a measured conversion number.

FORECAST

B2B arrives in month six.
The library doubles in month four.

What changed

- ◇ Five more tracks live by month four — eight in total
- ◇ A €29 tier opens alongside €19 once the library doubles
- ◇ B2B revenue begins month six, not year two
- ◇ Two vertical rollouts ready at corporate launch

Signups are capped at 400 · 800 · 1,200 a month by year three — the range this deck already states. Without that ceiling the model compounds into a number no solo founder reaches.

Plan against the conservative line. Everything above it is upside, not forecast.

Three lines, three different shapes.

Conservative case

Line	Year 1	Year 2	Year 3	Shape
Subscription	€13k	€32k	€40k	Compounds, then flattens against the signup ceiling
Delivery — 1:1 and workshops	€34k	€38k	€40k	Calendar-capped. Roughly flat whatever the funnel does
Organisations	€16k	€74k	€168k	Lumpy. The only line that scales with capacity, not reach

Why B2B carries years two and three

Subscription flattens once signups hit their ceiling. Delivery is capped by the calendar. Organisations is the only line that grows with contracted facilitator capacity rather than with reach — which is why the raise is spent on capacity, and why the top band cannot be sold before a second facilitator exists.

What capital actually buys.

The capped scenarios assume a founder selling alone with no acquisition budget. Funded, the constraint moves from reach to headcount — and headcount is a decision rather than a ceiling.

€1.24M

Year 3 revenue

2,589

paying members

€238K

peak cash need

Year 3

breakeven

Peak cash need is €238K. Breakeven arrives in year three, at roughly €156,000 of revenue per head across eight roles.

A small remote team, and the stack beneath it.

Founder / CEO

Sales-led. Enterprise pipeline and method

Enterprise AE

Carries the corporate number from year two

Marketing lead

Demand generation, content, the free-track SEO asset

Full-stack engineer

Organisation model, seats, SSO, admin, reporting

Clinical lead

Escalation criteria, protocol review, sourcing licensed practitioners

Facilitators — contract

Delivery capacity. Scales with contracted revenue, never behind it

Content producer

The remaining tracks — Sleep, Nutrition, Strength

Customer success

From year three. Renewals are where B2B compounds

The stack

Supabase (Frankfurt) • Paddle merchant of record • AI tooling and agentic development — Claude Max and Claude Code, ChatGPT, Runway, API • CRM and sales tooling • transactional and marketing email • SSO and identity • analytics and support desk • security and compliance tooling • legal, DPA, insurance and accounting • paid acquisition and events.

AI tooling runs €6,000 in year one to €28,000 in year three — against €20,000-plus a year of contract engineering, design and production it replaces. It is the reason one engineer is enough.

Why one engineer is enough.

This platform — thirty protocols, three hundred resources, the member architecture, the design system and every document in this deck — was built by one person using agentic tooling. That is not a cost saving. It is the operating model.

Contract engineering	€12,000–18,000	Claude Code, running written pass briefs against the repository
Design and collateral	€4,000–6,000	Mockups, decks and buyer documents, reviewed rather than commissioned
Video and motion	€2,000–4,000	Runway — the film, track banners, corporate collateral
Copy and documentation	€3,000–5,000	Protocol content, briefs, legal drafting for review
AI tooling, actual	€6,000–28,000	Year one to year three. Claude Max and Claude Code, ChatGPT, Runway, API

It compresses construction. It does not replace judgement.

What it does

- ◇ Writes and revises against a written specification
- ◇ Holds a large codebase in context across sessions
- ◇ Produces documents, mockups and briefs at speed
- ◇ Lets one engineer carry a platform build

What it does not

- ◇ Decide what is worth building
- ◇ Verify its own work against a live system
- ◇ Replace clinical, legal or commercial judgement
- ◇ Remove the need for review — which is where the time goes

Every defect this project has shipped traces to an unverified assumption entering a specification, not to the tooling failing. The discipline that catches it — written briefs, a fix register, verification through the route a member actually takes — is the part that does not scale automatically.

SEQUENCING

Consumer first — because it is the only fast feedback loop.

B2C has no procurement cycle, no buying committee and no clinical gate blocking the sale. Someone arrives, opens a protocol, and either returns or does not. That loop is measured in days. The corporate one is measured in quarters.

MONTHS 1-3

Build the library, open the market

Five more tracks ship. Eight live. The €29 tier opens — €19 for Tracks 02-04, €29 for all eight. First measured conversion number.

MONTHS 4-6

Prove it holds, open B2B

First cohort reaches its churn test. Clinical gate closes. Two pilots delivered and written up. Sector bundles drafted from real protocol-open data, not assumption.

MONTH 6

The raise conversation opens

Six months of traction, two findings reports, one named reference — built on \$15,000 and no paid acquisition.

The consumer build is a pricing prerequisite, not a content ambition — the €19/€29 split does not exist until eight tracks do. It de-risks the product, not the sale.

Ratios first. Volume second.

At this scale an investor is not testing whether we can buy users. They are testing whether the unit economics work when we do. 250 members at 4% churn is a better story than 800 at 12%.

MUST HIT

Free → paid conversion	≥ 3.5%	Below 3% the funnel is the problem, not the reach
Monthly churn, paid	≤ 6%	Above 6% annualises past 50% and every forecast collapses
Second-protocol open rate	≥ 45%	Whether the method transfers between states — the whole architecture
Paying members	≥ 180	The floor at which the two ratios above become meaningful

STRONG

300+ members	€6,500 MRR	≥20% on the €29 tier	2 pilot reports	1 named reference
--------------	------------	----------------------	-----------------	-------------------

If conversion comes in at 2%, that is information rather than failure — but it changes the raise. Path B assumes 4.2%.

€350,000 to breakeven.

The cumulative cash trough is €238,000, reached during year two. €350,000 covers it with a 12 per cent contingency and funds the operation to breakeven in year three — so the next conversation happens from revenue, not from runway.

Engineering — enterprise platform	€96,000	Organisation model, seats, SSO, admin, reporting. Twelve months
Marketing lead and acquisition	€92,000	Demand generation and the free-track SEO asset
Enterprise AE — from month seven	€48,000	Part-year. Carries the corporate number into year two
Clinical governance and facilitation	€34,000	Retainer, escalation criteria, first contracted facilitators
Content — Sleep, Nutrition, Strength	€28,000	Completes the substrate layer and opens the €29 tier
Legal, compliance, entity, insurance	€22,000	DPA, SCCs, trademark clearance, security review
Contingency — 12 per cent	€38,000	The gaps not yet visible

Capital is not needed to build the product — \$202,860 of it is already in. It is needed to buy distribution, delivery capacity and evidence.

€500,000 to €1.7M in year two.

The same business, hired ahead of proof instead of behind it. Enterprise platform in month six, three AEs by the start of year two, acquisition funded rather than organic.

	Path A · €350,000	Path B · €500,000
Year 1 revenue	€123,000	€283,000
Year 2 revenue	€631,000	€1,686,000
Year 3 revenue	€1,244,000	€3,233,000
Members, end of year 3	2,589	6,382
Peak cash need	€238,000	€397,000
Breakeven	Year 3	Year 2
Enterprise platform live	Month 12	Month 6
Sales headcount, year 2	1 AE	3 AEs
Free signups / month, year 2	4,000	9,000

Blended acquisition cost is €62 per paying member against €228 of first-year revenue at €19, or €348 at €29. That payback is what makes path B a plan rather than a hope.

One hires behind proof. The other hires ahead of it.

Path A · €350,000

- ◇ Founder carries the corporate pipeline through year two
- ◇ One AE, one marketing lead, one engineer
- ◇ Breakeven in year three at €1.24M
- ◇ Every hire follows evidence
- ◇ Survives a 2% conversion rate

Path B · €500,000

- ◇ Enterprise platform shipped in month six
- ◇ Three AEs and funded acquisition from year two
- ◇ Breakeven in year two at €1.69M
- ◇ First AE hired before the motion is proven
- ◇ Needs the 4.2% conversion rate to hold

Path B is worth more if it works and loses more if it does not. The variable that decides it is conversion — and nobody knows it yet, because no one has paid.
Path A produces that number in month six. It is available as a first tranche.

Three milestones, in order.

BY MONTH 6

Willingness to pay, established

A conversion rate from real signups. Two pilot findings reports written. First paid workshops and 1:1 delivered. The clinical gate closed.

BY MONTH 12

The corporate engine, running

Enterprise platform live — organisations, seats, SSO, reporting. First annual access contracts signed. One named reference customer. Eight tracks live and the €29 tier open.

BY MONTH 30

Breakeven

€1.2M run-rate. 2,500+ paying members. A corporate pipeline carried by an AE rather than the founder. The next conversation happens from revenue.

The milestone that de-risks everything is not revenue. It is two written pilot findings reports and a named reference customer — because that is the first question every organisational buyer asks.

What is not yet true.

Distribution does not exist	The forecast assumes 400–1,200 free signups monthly by year three. No mechanism currently produces one. The site is not indexed and there is no ad budget
Zero paying members	Production capacity is proven beyond argument. Willingness to pay is entirely untested
Facilitator capacity is the B2B ceiling	Roughly four hours a month exists. Annual access at the top band cannot be sold before a second facilitator is contracted
No organisation data model	Seats belong to individuals. Nothing represents an organisation, provisions seats, or produces the quarterly seats-in-use figure
Clinical contracting incomplete	Clinical lead in place; licensed third-party practitioners not yet contracted for the tracks that require them
Two external launch gates	Supabase provisioning and Paddle seller approval. Both outside founder control
Trademark proximity	An adjacent iOS product markets itself as “Regulate. Rewire. Rise.” To be cleared before wide launch
No acute short-form format	Every safety-critical sector needs something usable in a patrol car or between cases. The shortest resource in the library is far longer. A 90-second format is unbuilt
Implementation drift	Enough versions and decisions now exist that reviving a retired choice is the live operational risk. Decision-priority rules are documented

A deck that hides its biggest risk is worth less than one that names it.

THE POSITION, IN ONE LINE

A finished product in an unconsolidated market, looking for reach.

\$202,860 of work is in. Thirty protocols, three tracks, four revenue streams and two expansion axes are specified and built. The top five competitors hold 15% of the market between them. What is missing is distribution. €350,000 reaches breakeven; €500,000 reaches €1.7M in year two.
